

LORP Synopsis for March 2013

Compliance Comments:

Flows were well above the minimum flow for the month.

Maintenance work on the Langemann Gate at Intake started on 3/28/13. Current metering replaced realtime data during maintenance work through the end of the month.

Maintenance

Activities for the month on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.

Operations

Here are the flow changes during the month:

Langemann at Pump Station increased from 3 cfs to 4 cfs on March 1st, 2013.

LORP Intake increased from 40.2 cfs to 61 cfs on March 14th, 2013.

LORP Intake decreased from 61 cfs to 42 cfs on March 24th, 2013.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2012-13)

The runoff forecast for runoff year 2012-13 is 65%, so the waterfowl acreage goal for this year is 325 acres.

On April 17th the spring flows were set and so the inflows to Winterton were shut off and the inflows to Drew were increased to 7.1 cfs. When the wetted perimeter was measured with GPS in the middle of the spring season, the wetted area was 306 acres for Drew.

The June 1st waterfowl flow change for the Drew area was not performed due to the calculations based on the previous year's average coming up nearly the same (0.2 cfs lower) as the current April 16th set flow. When the wetted perimeter was measured with GPS in the middle of the summer season, the wetted area was 318 acres for Drew.

On August 21st the fall flows were set and so the inflows to Drew were decreased to 5.6 cfs. When the wetted perimeter was measured with GPS in the middle of the fall season, the wetted area was 334 acres for Drew.

On October 17th the winter flows were set and so the inflows to Drew were decreased to 1.8 cfs. When the wetted perimeter was measured with GPS in the middle of the winter season, the wetted area was 334 acres for Drew.

The average waterfowl wetted acreage for the 2012-13 was 327 acres, which is just above the goal of 325 acres.

FLOW CHANGE REQUEST/NOTIFICATION

ATTN: John Emory/Todd Bunn/Mark Wilder/Marty Bradley

DATE: March 13th, 2013

REQUESTED BY: E. Tillemans x30256

FLOW CHANGE LOCATION **LORP Intake**

START DATE: March 14th, 2013 TIME: anytime

CHANGE FLOW FROM: 40.2 cfs TO 61 cfs at LORP Intake

To maintain required flows to the LORP, monitor and make adjustments to the Aqueduct Intake gates for at least one day following this flow change.

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.

Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
