LORP Synopsis for February 2014

Compliance Comments:
Flows were above the minimum flow for the month.

The raw station data for LOR at Mazourka is incomplete. Data at this site is only valid through February 19 due to an issue with the internal recorder within the SonTek S/W meter. The data from February 19 through April 1 was corrupted on the recorder. The flow output function of the S/W meter continued to function properly through this time period which provides the reads for the RTU on site, the DWP HMI and ultimately the real time reads on the internet. These reads were verified by current meter shots conducted by DWP employees on: 2/4/14 and 3/4/14.

Maintenance

Activities for the month on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.

Operations

Here are the flow changes during the month:

Thibaut Pond diversion increased from 0.2 cfs to 0.5 cfs on February 5th, 2014.
Thibaut Pond diversion increased from 0.5 cfs to 1.0 cfs on February 25th, 2014.
Thibaut Pond diversion decreased from 1.0 cfs to 0 cfs on February 28th, 2014.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2013-14)
The runoff forecast for runoff year 2013-14 is 54%, so the waterfowl acreage goal for this year is 270 acres.

On April 16th the spring flows were set and the inflows to Drew were increased to 5.6 cfs. When the wetted perimeter was measured with GPS in the middle of the spring season, the wetted area was 299 acres for Drew.

On June 3rd the summer flows were set and the inflows to Drew were increased to 5.7 cfs. When the wetted perimeter was measured with GPS in the middle of the summer season, the wetted area was 278 acres for Drew.

On August 19th the fall flows were set and the inflows to Drew were decreased to 4.7 cfs. When the wetted perimeter was measured with GPS in the middle of the fall season, the wetted area was 287 acres for Drew.

On October 16th the Thibaut Waterfowl Area inflow was turned on to 1.0 cfs and the winter flows were set for Drew decreasing it to 1.8 cfs. When the wetted perimeter was measured with GPS in the middle of the winter season, the wetted area was 330 acres for Drew and 35 acres for Thibaut.

On January 16th the Thibaut Waterfowl Area inflows was decreased to 0.25 cfs.

[e] Flow estimated at Pump Station due to communication problems with the instruments.
1. Above Pump Station not constructed, the flow is the sum of the Pump station discharge, the Langemann Gate releases to the delta, and flow over the spillway weir to the delta.
2. Average of the LORP Intake, Mazourka Canyon, Reinhackle Springs, and At Pumpback Station stations.
3. Thibaut and Waggoner Water Areas are currently off.

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.
Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
