

LORP Synopsis for November 2010

Compliance Comments:

Flows were well above the minimum flows for the month and there were no issues of non-compliance related to river flows.

Maintenance

Activities for the month on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.

Operations

Here are the flow changes during the month:

Thibaut Pond decreased from 1 cfs to 0.5 cfs on November 16th, 2010.

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2010-11)

The Blackrock Waterfowl acreage goal for Runoff Year 2010-11 is 475 acres.

Taking into account water use, maximum capacities, and wildlife concerns DWP chose to maximize the Drew wetted acreage because it uses relatively less water than Waggoner and because it has displayed more diverse and robust wildlife. From observations during the 2009-10 runoff year, the best guess for the maximum capacity for the Drew Unit is between 290 and 300 acres before water levels reach the point where water starts spilling back into the Blackrock Return Ditch. Due to this, the flows to the Drew Unit will be set with a goal of 275 wetted acres. The remaining 200 acres will be achieved through the Waggoner Unit and flows there will be set with that goal in mind.

The preliminary waterfowl operation protocol calls for the previous ET-season flow vs. acreage ratios to be used in order to set new flows. However, the 2009 spring data is skewed to a very high inflow ratio due to the 'wetting up' period both Drew and Waggoner went through from mid April through mid August last year. As such, because the seasonal ET rates of spring and fall are usually similar, the ratios from the fall of 2009 were used instead of the artificially high ratios from the spring of 2009.

Beginning April 20th the new flows were set and based on the fall 2009 ratios, resulting in a 6.6 cfs inflow to the Drew Waterfowl Area and a 7.2 cfs net inflow to the Waggoner Waterfowl Area. When the wetted perimeter was measured with GPS in the middle of the spring season, the wetted area was 276 acres for Drew and 229 acres for Waggoner. At the end of spring the wetted area was 289 for Drew and 321 for Waggoner.

For the summer flows, the Drew and Waggoner areas in 2009 were also still 'wetting up' for much of the summer, but not as drastically as it had been during the spring. In order to set the flows for summer 2010, the average acreage for middle and end of summer reads were used to set the ratios (instead of using the middle only). Using the average of the two reads results in a 6.8 cfs net flow to Drew and a 8.1 cfs flow to Wagoner which were set on June 1st. When the acreage was GPS'd on July 7th, Drew came in at 307 acres while Waggoner came in at 352 acres (for a total of 659). For the end of summer reads GPS'd on August 17th, Drew came in at 313 acres while Waggoner came in at 304 acres (for a total of 617). Clearly the flow ratios set for the summer were too high, but the methods to calculate the flow ratios will automatically adjust to compensate for the summer 2011 inflows.

Beginning August 16th the new flows were set and based on the fall 2009 ratios, resulting in a 6.6 cfs inflow to the Drew Waterfowl Area and a 7.2 cfs net inflow to the Waggoner Waterfowl Area. When the wetted perimeter was measured with GPS on September 15th in the middle of the fall season, the wetted area was 328 acres for Drew and 312 acres for Waggoner. At the end of the fall season (mid-October), the wetted area was 331 and 390 respectively.

Beginning October 16th winter flows were set based on the Winter 2009-10 ratios, resulting in a 2.1 cfs inflow to the Drew Waterfowl Area and a 1.6 cfs net inflow to Waggoner Waterfowl Area. The mid-season measurement will occur in January 2011.

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.

Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
