LORP Synopsis for April 2009

Compliance Comments:
Flows were well above the minimum flows for the month and there were no issues of non-compliance related to river flows.

Maintenance

Activities for the month of April on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables. These tables are being updated bi-weekly and downloaded to the SonTek flowmeters monthly to aid in the calibration of the meters.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.
- The stations with culverts continue to be cleaned since starting flows using high pressure hoses and brooms. The sediment continues to build up at various stations and seems to be an on-going issue.
- On April 1st, the recording equipment at the Delta stations were removed and then on April 7th the measuring equipment was removed. Flows at the Delta will no longer be measured.

Operations

<u>Here are the flow changes during the month:</u>
LORP Intake decreased from 50 cfs to 44 cfs on April 16th, 2009.

Waterfowl Area Monthly Report

Synopsis

The plan for the 2009-2010 runoff year calls for the drying up of the Thibaut and Winterton Waterfowl Areas and the wetting up of the Drew and Waggoner waterfowl areas. The wetted acreage goal for the 2009-2010 runoff year is 355 acres.

Per the revised and agreed upon Blackrock Waterfowl Area Operation Procedures issued in May of 2009, there will be a Waterfowl Area monthly report beginning with the April 2009 monthly report and every month thereafter. The new plan called for setting the flows in the waterfowl areas based on the historical history of each area. For the Drew and Waggoner Units, the first year flows were to be set based on the history of the Winterton area.

The timing of the first on flows were delayed due to the late adoption and modifications of the new Operation Procedures. Flows at the Drew and Waggoner Units should have been turned on to 4 cfs beginning on April 1 per the new agreement. What actually occurred is shown in the following table:

Drew Unit

Inflow	Date Set	Wetted Acreage	Date of GPS
3cfs	4/21/09	No Reads Taken	
4cfs	4/29/09		

Waggoner Unit

Inflow	Date Set	Wetted Acreage	Date of GPS
3cfs	4/21/09	No Reads Taken	
4cfs	4/29/09		

At the same time, the Winterton and Thibaut areas had their flows run longer than they should have under the new operation agreement. Winterton ran at 2 cfs until 4/21/09 and Thibaut ran at 1 cfs until 4/21/09. The Recorded acreages for these areas were:

Winterton Unit

Wetted Acreage	Date of GPS
157	4/1/2009
162	4/13/2009

Thibaut Unit

Wetted Acreage	Date of GPS
118	4/8/2009
175	4/13/2009

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.
Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
